

## DataSnipper Platform v4.0

Improve the speed and quality of your audit procedures

### Search & Snip

Search and Snip is a new feature speeding up your Snipping actions. This feature is very helpful to boost for example your walkthrough procedure. It is now possible to directly Snip from the search result pane, across different documents.

### Undo snipping and deletion with CTRL Z

It is now possible to undo your last Snip action with 'Control + Z'. You can only undo your most recent Snip. If your most recent Snip was copied from another Excel workbook, it will only undo the Snip, but the referenced document to the Snip will not be removed.

### Paste snips into a different workbook with CTRL V

It is now possible to copy Snips from one Excel workbook to another Excel workbook with 'Control + v'. DataSnipper will copy the Snip to the selected cell. The document referenced to the Snip will automatically be imported.

### Edit rows in Table Snip

It is now possible to edit the purple selection rows after Snipping a table. With this new feature, you are more flexible in the way your table data is extracted to your Excel workbook.
